

Pre-Installation Notes - Oracle 11G

supportcenter.nc4.com/hc/en-us/articles/218000657-Pre-Installation-Notes-Oracle-11G

Editing - For Oracle 11G the database user should have the following privileges:

1. Package Object Privileges, Execute Privilege should be selected with the Schema 'CTXSYS' and Object 'CTX_DDL'.

2. The following Roles should be assigned to the user: viz RESOURCE, CTXAPP and CONNECT.

For Oracle VPD installs, in addition to the Operations and Training databases, a third database is required. The name of this database must be ETEAM.

3. The following System Privileges should be assigned to the database user as well, as shown in the screenshot below.

- The system administrator privilege can be revoked after the installation is completed.
- The port on which the SQL server or Oracle is listening for connections is required for this installation. For SQL Server this information can be found by navigating to:
 - Start -> Programs -> SQL Server -> Server Network Utility
 - Select TCP/IP under Enabled Protocols and click the Properties Button.
 - Select and reconfigure the listener and it will display the port used. This utility will also allow you to change the port used. The default port for Oracle Listener is 1521.
