

Introduction to E Team Configuration Documents

 supportcenter.nc4.com/hc/en-us/articles/218311427-Introduction-to-E-Team-Configuration-Documents

E Team Administration contains documents that are considered an integral part of your E Team application.

A single User ID and password are created during the E Team installation. This ID is automatically added to the ETeam System Admin Group, thereby providing a way for an Administrator to log into the application, complete system configuration, and perform the steps necessary to setup additional E Team Users.

The bulk of configuration is performed within the browser after logging into the E Team application. In some cases server access is required.

E Team Operations and Training databases are independent of each other. Configuration is required within each database. Contact support@nc4.com for assistance in copying configuration between the databases.

The E Team application consists of both:

System configuration documents, each containing information that is critical to the E Team application.

- General Configuration (shown as Configuration in the menu)
- DRS Configuration
- Data Sharing Configuration
- GIS Configuration
- Custom Forms Configuration
- Dashboard Configuration
- User Registration Configuration
- Archiving Configuration

Optional configuration documents, each containing information that is critical to setting up interfaces to other systems supported by E Team.

- IPAWS Interoperability Configuration
- NC4 Risk Center-to-E Team Configuration
- ERMS Configuration
- Everbridge Configuration
- EMSystems Configuration
